

ConnQ — QA Testing Report

Prepared for: Cloud Sathi — QA Intern Assessment

Tester:	Amisha Kumari
Submission Date:	June 21, 2026
App Tested:	ConnQ — Smart Digital Card (com.cloudsathi.connq)
App Version:	1.0.5 (13)

Executive Summary

This report covers QA testing of the ConnQ digital business card application across Android and iOS, focused on onboarding, profile management, QR code sharing, analytics, and multi-profile (PRO) functionality. Of 30 test scenarios attempted, the majority passed; the failures and partial results point to four recurring themes: **silent data loss** on save, **incomplete analytics tracking**, **stale UI that requires manual refresh**, and **generic (non-personalized) shared link previews**. Eight distinct bugs were logged, including two High-severity issues affecting data integrity. The two remaining untested scenarios relate to a privacy/visibility control feature that is referenced in the app’s own marketing copy but could not be located anywhere in the UI during testing.

Total Scenarios	Bugs Logged	Result Breakdown	Bug Severity
30	8	Pass: 21 (70%) Fail: 5 (17%) Partial: 2 (7%) Not Tested: 2 (6%)	High: 2 Medium: 4 Low: 2

1. Device Details

Field	Android	iOS
Device Model	Realme 9i (RMX3491)	iPhone 17 Pro Max
OS Version	Realme UI 4.0 (Android 13)	iOS 26.2.1
App Version Installed	1.0.5 (13)	1.0.5 (13)
Testing Method	Physical device (borrowed) — primary, in-depth testing	Physical device (own) — used for cross-platform QR scan verification

Note: Testing was conducted primarily on Android, with iOS used specifically to verify the cross-platform QR code scanning and sharing flow (Section 2, item 11 and 23). If time allows before submission, repeating a few core scenarios (profile creation, login) directly on iOS would strengthen platform coverage.

2. Test Scenarios Performed

#	Feature	Test Performed	Result	Notes
1	Onboarding	Sign up with valid email and password	Pass	Account created successfully, no crash
2	Onboarding	Login with valid credentials	Pass	Logged in successfully
3	Onboarding	Login with incorrect password	Pass	Correct error handling, no crash
4	Onboarding	Forgot password flow	Pass	Email entry → OTP sent and flow completed successfully
5	Profile Creation	Fill all fields (Name, Headline, Field of Interest, Website, Social Link, Bio) and save	Fail	“Field of Interest/Work” value did not persist after saving — see Bug #2
7	Profile Creation	Upload a profile photo	Pass	Photo uploaded, cropped, and displayed correctly on card
8	Profile Creation	Enter emoji/special characters in name field	Fail	“Failed to update card” error shown, save blocked entirely — see Bug #7
9	Profile Creation	Exceed field character limit	Pass	Phone number field correctly enforces a 10-digit limit (10/10 counter)
10	QR Code	Generate QR code for profile	Pass	QR code displayed clearly, full-screen view available
11	QR Code	Scan generated QR with a different device’s camera (iOS scanning Android-generated code)	Pass	Opened the correct profile successfully
12	Sharing	Share profile link via WhatsApp	Pass	Link sent successfully, opened correct profile when tapped — but see Bug #6 (preview not personalized)
13	Receiver Experience	Open shared link without the app installed	Partial	Link is reachable; full visual rendering not independently confirmed (page requires JavaScript)
14	Receiver Experience	“Add to Phone” (save to contacts)	Pass	Contact saved successfully
15	Multi-Profile	Create a second profile (Business Card)	Pass	Card created and displayed separately from Personal Card with its own QR code — but see Bug #8 (business name truncated on display)
16	Multi-Profile	Switch between / manage multiple profiles	Pass	Both cards are listed together on the My Cards screen with no data bleed between them; app uses a list view rather than an explicit “switch” toggle, which satisfies the underlying requirement
17	Privacy	Mark a contact field private	Not Tested	Checked Edit Card field rows and the Account section; no privacy/visibility toggle could be found anywhere in the app — see Suggestions
18	Privacy	Mark a contact field public	Not Tested	Same as above; feature could not be located despite being referenced in the app’s own marketing description

#	Feature	Test Performed	Result	Notes
19	Analytics	View profile, then check Insights dashboard	Partial	Scan/click counts were accurate, but did not update without a manual refresh — see Bug #5
20	Permissions	Review permissions requested on install	Pass	Reviewed via Android system settings: Notifications allowed; Camera, Contacts, and Location listed as not granted (not yet requested/used) — all reasonably justified by the app’s stated functionality
21	Network	Use app with no internet connection	Pass	Existing cards remained viewable (cached); attempting to save an edit while offline correctly showed a “no internet connection” message rather than crashing or hanging
22	Stability	Background app mid-edit, then resume	Pass	Unsaved edit was preserved after backgrounding and returning to the app
23	Cross-Platform	Same account/profile accessed from Android and iOS	Pass	Profile opened correctly on iOS via QR scan of Android-generated code
24	UI/UX	Rotate device / different screen sizes	Pass	Layout adapted correctly to landscape when the phone’s system auto-rotate was enabled; app follows system rotation setting rather than overriding it
25	Session	Log out of account	Pass	Logged out and back in successfully; account and card data persisted correctly across the session
<i>Additional checks performed (outside the original scenario list)</i>				
26	Theming	Switch theme (Dark Mode) and confirm it persists across navigation	Pass	Theme correctly applied and persisted
27	Settings	Open Settings screen; confirm version info and policy links are present	Pass	Version 1.0.5 (13) confirmed; Privacy Policy and Terms of Service links present
28	Analytics	Cross-check “Top Actions” counts against actions actually performed (Call, WhatsApp, Email, Save Contact, Save to Gallery)	Fail	Call and Save to Gallery were performed successfully but not reflected in tracked actions — see Bug #4
29	Sharing	Fetch shared profile URL directly to inspect link-preview metadata	Fail	Open Graph metadata is generic (“ConnQ” branding), not personalized to the card owner — see Bug #6
30	Billing	Start PRO trial (required to unlock multi-profile creation)	Pass	No payment information required; flow consists of use-case selection (Personal/Business/Both) and feature-module selection before activation

#	Feature	Test Performed	Result	Notes
31	Profile Creation	Compare entered Business Name against the name displayed on the resulting card	Fail	Entered “Kalyani jha” but card displays only “Kalyani” — see Bug #8

3. Issues / Bugs Found

#	Description	Severity	Steps to Reproduce
1	Social link platform icon does not render — a generic “?” icon shows instead of the Instagram logo in the Social Links section.	Low	Edit Card → scroll to Social Links → default platform shown is Instagram.
2	“Field of Interest/Work” value is lost after saving the profile card, despite a “Card updated successfully” confirmation message. Re-opening Edit Card confirms the value does not persist.	High	Edit Card → enter text in Field of Interest/Work → Save Changes → success message appears → exit and re-enter Edit Card → field is empty.
3	Text input fields (Full Name, Headline) do not auto-capitalize the first letter, unlike standard mobile keyboard conventions for name-type fields.	Low	Type a lowercase name or headline into the Full Name or Headline field; text remains exactly as typed.
4	The Insights/Top Actions panel does not log all trackable interactions. “Call” (opens dialer) and “Save to Gallery” were both performed successfully but do not appear in the Actions count, while Email, Save Contact, and WhatsApp do.	Medium	Open the public card preview → tap Call and tap Save to Gallery → go to Insights → Top Actions does not include either.
5	The Insights dashboard does not refresh automatically. New activity (scans, clicks) is tracked correctly on the backend, but the screen does not reflect it until the app is manually refreshed or reopened.	Medium	Perform a trackable action → check Insights immediately → numbers unchanged → force-close and reopen the app → numbers now update correctly.
6	Shared profile links do not generate personalized link previews. Fetching a shared link’s metadata (Open Graph / Twitter Card tags) shows generic “ConnQ – Your Smart Digital Connection” branding rather than the card owner’s name or photo.	Medium	Share any profile link via WhatsApp/SMS → inspect the link preview shown before opening, or fetch the URL’s raw metadata directly.
7	Saving a profile fails when an emoji is entered in the Full Name field. The app shows a generic “Failed to update card” error and the update does not go through.	High	Edit Card → enter an emoji into the Full Name field → tap Save Changes → “Failed to update card: We’ve encountered an unexpected hiccup” error appears.
8	The Business Name entered when creating a second (Business) card is truncated on display. “Kalyani jha” was entered, but only “Kalyani” appears on the resulting card — inconsistent with the Personal Card, where the equivalent full name displays correctly in the same layout.	Medium	My Cards → Create Business Card → enter a two-word Business Name → Create Card → card preview shows only the first word.

4. Severity Level Reference

Severity	Definition	Example
High	App crashes, data loss, or a core feature completely fails	A user's entered data silently fails to save, despite a success confirmation
Medium	A feature works but with a noticeable flaw or inconsistency	Analytics data is accurate but does not refresh without a manual reload
Low	Minor cosmetic or behavioral issue with no functional impact	A platform icon fails to render; a field doesn't auto-capitaliz

5. Suggestions for Improvement

- **Fix the silent data-loss bug on save** (Bug #2) as the top priority — a success message that doesn't reflect what was actually saved is a trust-breaking issue for users.
- **Add real-time or pull-to-refresh updates to the Insights dashboard** rather than requiring users to restart the app to see current stats.
- **Track all meaningful contact actions** (including Call) in analytics, since for a networking app, a phone call is arguably the highest-value lead action and is currently invisible in reporting.
- **Personalize Open Graph metadata per profile** so that links shared via WhatsApp, iMessage, or social platforms show the actual card owner's name and photo rather than generic app branding — this directly affects how compelling a shared card looks to its recipient.
- **Profile photo and Card photo are separate, unsynced fields.** For users with a single card, this could be confusing; consider either syncing them by default or making the distinction clearer in the UI.
- **Add a “view photo” option.** Currently tapping the profile/card photo only opens the edit/replace flow, with no way to simply preview the current photo at full size.
- **Fix Business Name truncation on card display** (Bug #8) and audit other business-card-specific fields for similar display inconsistencies, since this card type appeared to receive less testing/polish than the Personal Card.
- **Surface or build the per-field privacy/visibility controls** referenced in ConnQ's own app description (“choose exactly which contact details are public and which are kept private”). This feature could not be located anywhere in the app during testing — either it doesn't exist yet in this version, or it isn't adequately surfaced in the UI. Worth confirming with the product team, since this is a stated core feature.
